

## LASER HARP

Musical show with Laser Harp

### Technical requirements for indoor setups:

- The ideal space required is *3 meters x 3 m*.
- The Laser Harp can be positioned directly on the floor, however ideally there should be a small stage that raises everything for a better visual enjoyment of the performance.

### In the point chosen for positioning the Laser Harp there must be:

- *220 Volts electrical socket (Schuko model)*.
- *Balanced XLR cables (left/right)* for the audio connection from our mixer to the control desk.

### Fundamental requirements:

- It is absolutely necessary to create **dark or semi-dark conditions** in the performance area.
- Smoke machines (water vapor) will be used to display the Laser Harp, **therefore the fire-smoke alarm system in the area must be deactivated** in the dedicated room during the show.  
**This is very important, without diffusion of ambient smoke the Harp of Light is not visible!**
- The Laser Harp must **not be** placed in a point where the ceiling has reflective surfaces (glass, mirrors, etc.).
- Total electrical current absorption of Laser Harp instruments 3kW.
- **The complete setup of the Laser Harp is to be considered fixed in the chosen location.**  
If it is necessary for the organizational needs of the event to move and reposition the Laser Harp, the organization must provide an adequate platform with wheels of at least 2 meters x 2 m. on site.

### Important:

The above requirements refer to setups in **closed environment (indoor)**, for outdoor presentations it is necessary to evaluate, each time, the feasibility of the Show.

**h 1,75 cm**
